**Q1**. A pulse tracer input into a PFR showed the following outlet concentration: The experimental data between 2 and 4 min were fit into the line equation  $C_{out} = -2t + 17$ , with  $C_{out}$  in [mM]\* and t in [min].

- a) Find the RTD function.
- b) Find mean residence time.
- c) Find variance.
- d) What is the fraction of material that spends in the reactor 3 minutes and longer?
  - [M] means [mol/L] it is a molar concentration in a fluid (gas or liquid)

**Q2**. Residence time distribution in real reactors and its characteristics. *From Chapter 13, 4th Ed. Fogler* 

The following data were obtained from a pulse tracer test to a real flow reactor:

t(s)	0	5	10	15	20	25	30	35
C(mg/dm <sup>3</sup> )	0	0	0	5	10	5	0	0

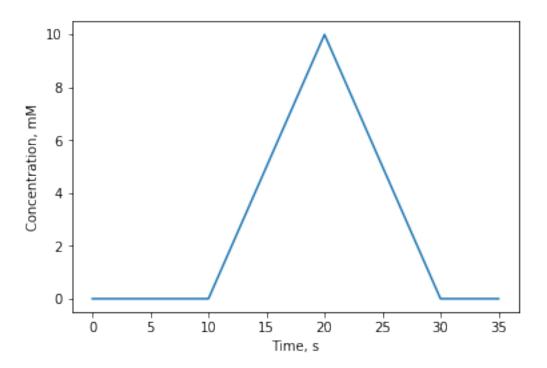

- a) Plot RTD function
- b) Find the fraction of material that spends between 15 and 20 seconds in the reactor
- c) Plot cumulative distribution function F(t)
- d) What fraction of the material spends 25 seconds or less in the reactor?
- e) Find mean residence time.

**a.** RTD function is 
$$E(t) = \frac{C(t)}{\int_0^\infty C(t)dt}$$

To find the total concentration in the denominator, we plot C(t) vs. time and evaluate the area:

```
C_{t}
O_{t}
O_{t
```
